

Syndromic surveillance for the detection of emerging and re-emerging diseases in cattle

Aurélien Madouasse

July 16, 2015

Emerging and re-emerging diseases in cattle

- Over the past 20 years:
 - Bovine spongiform encephalopathy
 - Foot and mouth disease
 - Bovine neonatal pancytopenia
 - Bluetongue virus
 - Schmallenberg virus

Emerging and re-emerging diseases in cattle

- Over the past 20 years:
 - Bovine spongiform encephalopathy
 - Foot and mouth disease
 - Bovine neonatal pancytopenia
 - Bluetongue virus
 - Schmallenberg virus
- Disease that were unknown or not present in the population

Emerging and re-emerging diseases in cattle

- Over the past 20 years:
 - Bovine spongiform encephalopathy
 - Foot and mouth disease
 - Bovine neonatal pancytopenia
 - Bluetongue virus
 - Schmallenberg virus
 - Disease that were unknown or not present in the population
- ⇒ Relevance of targeted surveillance limited for most diseases:
- Impossible to test for all known and unknown diseases that could emerge
- ⇒ Syndromic surveillance

Syndromic surveillance

- Aim:
 - Detect potentially unknown health disorders through their consequences
- Detection of an abnormal event:
 - Must be precocious
 - Leads to further investigations allowing the identification of the cause

Syndromic surveillance

- How to?
 - Collect relevant data
 - Construct indicators
 - Look for unusual patterns and deviations
 - Detection of abnormal events leads to further investigations and action
- ⇒ All this must be performed in close to real-time

Emergence of BTV

- Bluetongue virus
 - Emerged in Northern Europe in 2006
 - Emerged in France in 2006-2007
(Notification of clinical suspicions was mandatory)
 - Spread in France until 2010
 - Caused reproductive disorders, abortions, mortality, drop in milk production, ...

Emergence of BTV

- Bluetongue virus
 - Emerged in Northern Europe in 2006
 - Emerged in France in 2006-2007
(Notification of clinical suspicions was mandatory)
 - Spread in France until 2010
 - Caused reproductive disorders, abortions, mortality, drop in milk production, ...
- EMIDA ERA-NET research project on testing indicators constructed from milk production and reproduction in dairy cattle for the detection of such emergences

2007 emergence of BTv

- Milk production data
 - Milk recording
 - Individual cow milk production collected monthly
- Prediction of expected milk production/herd/week
- Detection of clusters of recorded < expected

Preventive Veterinary Medicine 113 (2014) 484–491

Use of monthly collected milk yields for the detection of the emergence of the 2007 French BTv epizootic

2007 emergence of BTV

- Reproductive data
 - Artificial insemination
 - Each artificial insemination recorded
 - Calving dates available
 - 5 indicators tested
 - Best indicator: proportion of cows calving a few days earlier than expected

2007 emergence of BTV

- Reproductive data
 - Artificial insemination
 - Each artificial insemination recorded
 - Calving dates available
 - 5 indicators tested
 - Best indicator: proportion of cows calving a few days earlier than expected

Final thoughts

- Most timely and specific indicator identified in our study : short gestations
 - Not a disease!
 - Increase in the frequency of occurrence of an event in the range of normality
 - ⇒ Identification requires the use of appropriate methods
- False alarms = major problem
 - Lead to unnecessary investigations
 - Trade-off with timeliness
 - ⇒ Combination of indicators can help to increase the specificity of detection

Final thoughts

- Data
 - Essential!
 - Need to identify sources, relevance and availability
 - Who owns them? Governments, farmers, industry ...
 - ⇒ Need to see the interest of sharing
- Added value of syndromic surveillance?
 - What could have been achieved in past instances? (BSE, foot and mouth, BTV, Schmallenberg)
 - + Detecting earlier → economic impact, consequences on animal health and welfare ...
 - Cost of running the system
 - ⇒ How should the costs be shared?

Thank you!
